Test delay equations

Logistic Delay Differential Equation (DDE):

$$y'(t) = r\,y(t)\,(1 - y(t-1))\,, \qquad t \geq 0,\, r > 0$$

A cannibalism model formulated as Renewal Equations (RE):

$$y(t) = \frac{\gamma}{2} \int_{a_0}^{\tau} y(t-a)\, \mathrm{e}^{-y(t-a)}\, \mathrm{d}a, \qquad t > 0,\, \gamma > 0$$

Note:

- delay (bounded)
- both point delays and distributed delays
- dependence on parameters: r, γ
- history function: $y_t(\theta) := y(t+\theta), \qquad \theta \in [-\tau, 0],$

The abstract Cauchy problem

Setting $v(t) := y_t(\cdot)$, we can write a DE as an abstract equation

$$\frac{d}{dt}v(t) = \mathcal{A}v(t), \qquad t \geq 0$$

for some initial condition $v(0) = \psi$ and

$$\mathcal{A}\psi = \psi', \qquad \psi \in D(\mathcal{A})$$

The abstract Cauchy problem

Setting $v(t) := y_t(\cdot)$, we can write a DE as an abstract equation

$$\frac{d}{dt}v(t) = \mathcal{A}v(t), \qquad t \geq 0$$

for some initial condition $v(0) = \psi$ and

$$\mathcal{A}\psi = \psi', \qquad \psi \in D(\mathcal{A})$$

For a DDE $y'(t) = f(y_t)$, we have

$$D(\mathcal{A}) = \{\psi, \psi' \in C([-\tau, 0]) \colon \psi'(0) = f(\psi)\}$$
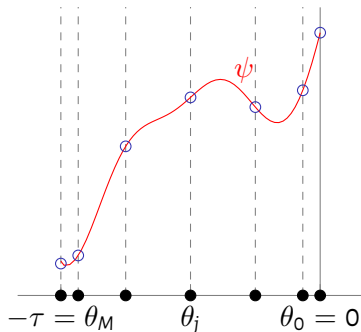

For a RE $y(t) = f(y_t)$, we have

$$D(\mathcal{A}) = \{\psi, \psi' \in L^1([-\tau, 0]) \colon \psi(0) = f(\psi)\}$$
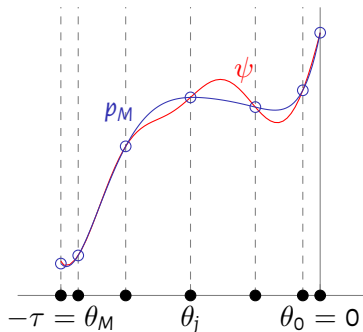

From infinite dimension to finite dimension

via pseudospectral methods

Mesh of $M + 1$ nodes in $[-\tau, 0]$
$$-\tau = \theta_M < \cdots < \theta_0 = 0$$

From infinite dimension to finite dimension
via pseudospectral methods

Mesh of $M + 1$ nodes in $[-\tau, 0]$
$$-\tau = \theta_M < \cdots < \theta_0 = 0$$

function in $Y \approx$ polynomial of degree M

$$\psi(\theta) \approx p_M(\theta) = \sum_{j=0}^{M} \ell_j(\theta)\psi(\theta_j)$$

with $\ell_j(\theta)$ Lagrange polynomials:

$$\ell_j(\theta) = \prod_{k \neq j} \frac{\theta - \theta_k}{\theta_j - \theta_k}$$

Delay differential equations

Abstract equation in C

$$\dot{v}(t) = \mathcal{A}(v(t))$$

$$v(t) \in D(\mathcal{A}) = \{\psi'(0) = f(\psi)\}$$

Delay differential equations

<div>

Abstract equation in C

$$\dot{v}(t) = \mathcal{A}(v(t))$$

$$v(t) \in D(\mathcal{A}) = \{\psi'(0) = f(\psi)\}$$

</div>

$\Rightarrow$

<div>

ODE in $\mathbb{R}^{M+1}$

$$\dot{v}_0 = f(p_M(v_0, \ldots, v_M))$$

$$\dot{v}_k = \sum_{j=0}^{M} d_{kj} v_j, \ k = 1, \ldots, M$$

</div>

- system of $M + 1$ ODEs, with $v_k(t) \approx v(t)(\theta_k)$
- linear part for differentiation independent of the specific equation, $d_{kj} = \ell_j'(\theta_k)$
- the right-hand side f appears only in the equation for v_0
- Chebyshev nodes (roots or extrema) ensure convergence
- ODE system can be studied with established software

Bifurcation analysis and MatCont

Bifurcation analysis — how the dynamical long-term properties depend on parameters

MatCont — a software package for the bifurcation analysis of ODEs

- MATLAB package, available on sourceforge.net
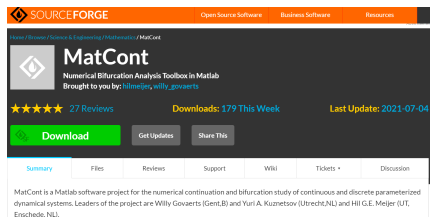

Bifurcation analysis and MatCont

Bifurcation analysis — how the dynamical long-term properties depend on parameters

MatCont — a software package for the bifurcation analysis of ODEs

- MATLAB package, available on sourceforge.net
- numerical continuation of equilibria and periodic orbits with respect to parameters
- other packages for ODEs, e.g. AUTO, but an important point is the possibility of varying the dimension of the system
- dde-biftool is a similar MATLAB package for DDEs with discrete delays

MatCont example: logistic DDE

$$y'(t) = r\, y_t(0)\,(1 - y_t(-1))\,, \qquad t \geq 0,\, r > 0$$

With $v_k \approx y_t(\theta_k)$, the approximating ODE reads

$$\dot{v}_0(t) = r\, v_0(t)\,(1 - v_M(t))$$

$$\dot{v}_k(t) = \sum_{j=0}^{M} d_{kj} v_j(t),\ k = 1, \ldots, M$$

Renewal equations and the integrated state

Given a renewal equation, $y(t) = f(y_t)$, $t > 0$, consider

$$v(t)(\theta) := \int_0^\theta y_t(s)\, \mathrm{d}s, \qquad \theta \in [-\tau, 0]$$

and the operator $\mathcal{A}\psi = \psi'$, $\psi \in D(\mathcal{A}) = \{\psi \in L^1 \colon \psi' \in NBV,\ \psi(0) = 0\}$.

Abstract equation in *NBV*

$$\dot{v}(t) = \mathcal{A}v(t) - f(\mathcal{A}v(t))$$

$$v(t) \in D(\mathcal{A}) = \{\psi(0) = 0\}$$

$\Rightarrow$

ODE in $\mathbb{R}^M$

$$\dot{v}_k = \sum_{j=0}^M d_{kj} v_j - f(p'_M),\ k = 1, \dots, M$$

$$p_M = p_M(0, v_1, \dots, v_M)$$

- $y_t \in L^1 \Rightarrow v(t) \in AC$
- algebraic condition for v_0 replaced by nonlinear perturbation

MatCont example: a RE for cannibalism

$$y(t) = \frac{\gamma}{2} \int_{a_0}^{\tau} y_t(-a) \, e^{-y_t(-a)} \, da, \qquad t > 0, \, \gamma > 0$$

With $v_k \approx \int_0^{\theta_k} y_t(s) \, ds$ and $p_M = p_M(0, v_1, \ldots, v_M)$, the approximating ODE reads

$$\dot{v}_k(t) = \sum_{j=0}^{M} d_{kj} v_j(t) - \frac{\gamma}{2} \int_{a_0}^{\tau} p_M'(-a) \, e^{-p_M'(-a)} \, da, \, k = 1, \ldots, M$$

MatCont example: a RE for cannibalism

$$y(t) = \frac{\gamma}{2} \int_{a_0}^{\tau} y_t(-a) \, e^{-y_t(-a)} \, da, \qquad t > 0, \, \gamma > 0$$

With $v_k \approx \int_0^{\theta_k} y_t(s) \, ds$ and $p_M = p_M(0, v_1, \ldots, v_M)$, the approximating ODE reads

$$\dot{v}_k(t) = \sum_{j=0}^{M} d_{kj} v_j(t) - \frac{\gamma}{2} \int_{a_0}^{\tau} p'_M(-a) \, e^{-p'_M(-a)} \, da, \; k = 1, \ldots, M$$

$$= \sum_{j=0}^{M} d_{kj} v_j(t) - \frac{\gamma}{2} \sum_{j=1}^{M} w_j p'_M(-a) \, e^{-p'_M(-a)} \, da$$
